

Topology and Neuroscience:

Data analysis

Yuri Dabaghian

Baylor College of Medicine & Rice University

dabaghian at rice.edu

Hippocampus and space coding

- Forming new memories

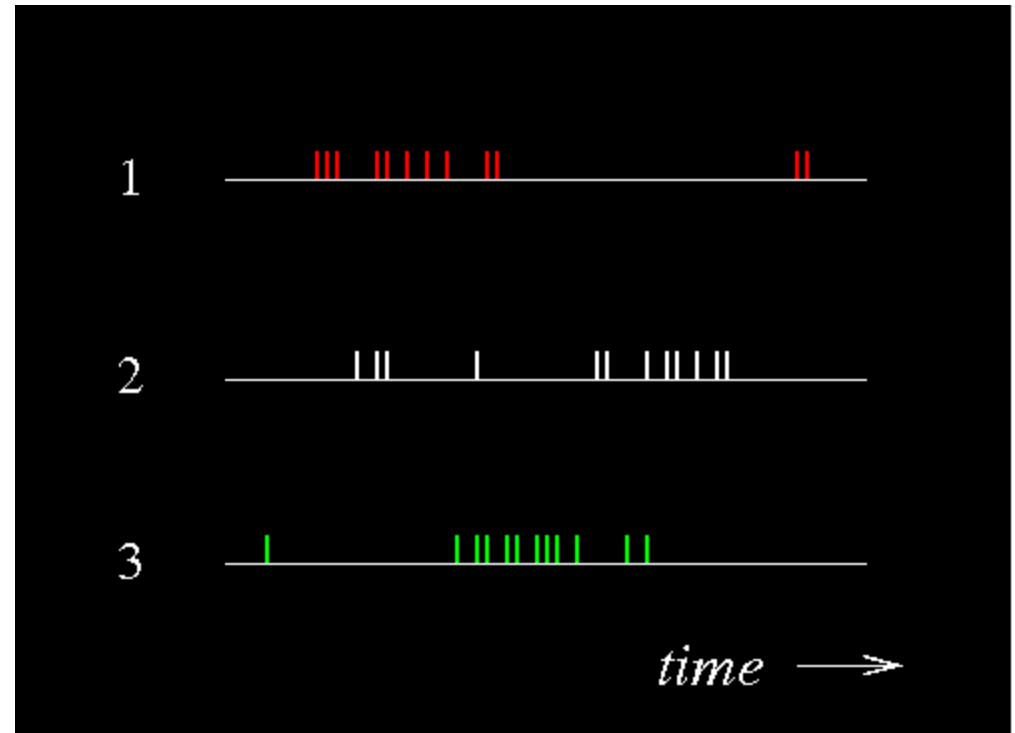

- Spatial behavior, spatial memory
 - navigation, navigation planning
 - imagining spatial scenes

Electrophysiology of spatial coding

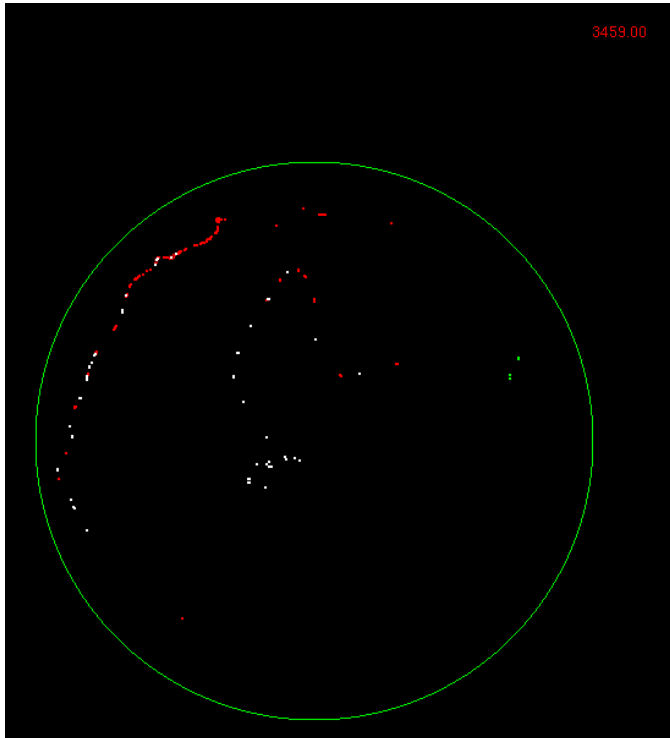

Electrophysiology of spatial coding

Electrophysiology of spatial coding

Firing activity is correlated with spatial location

Hippocampal spatial map

~ 4,000 cells are active simultaneously
on each side

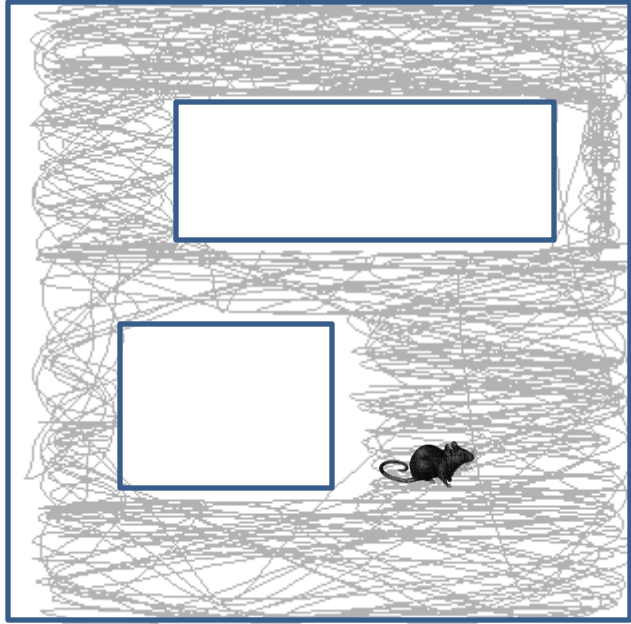

~400,000 cells total on each side

The ensemble of place cells forms a map of the environment

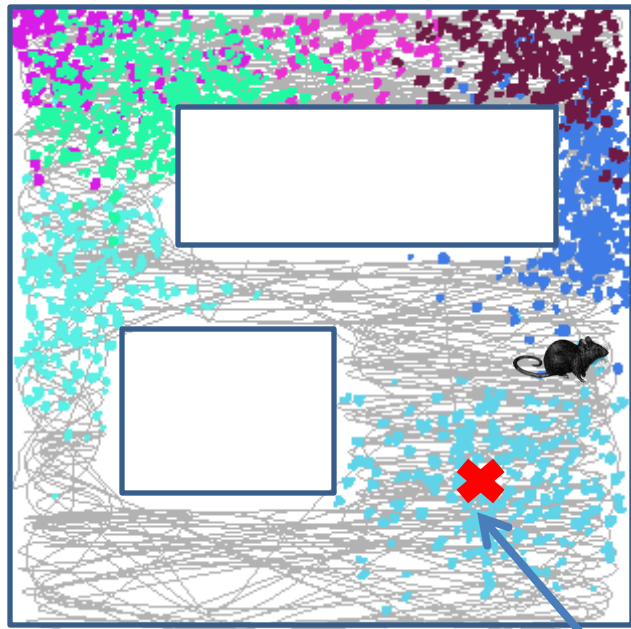

A space with 2 holes

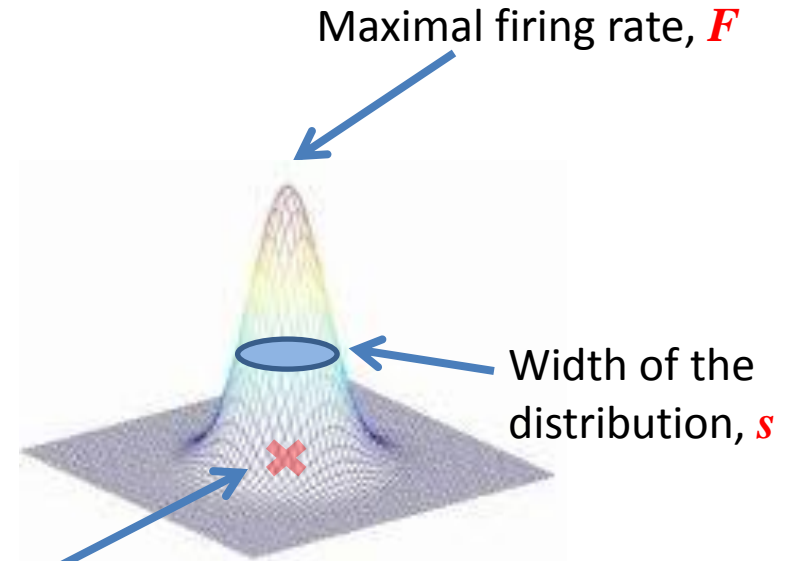

Environment with 2 holes + trajectory

Examples of simulated place fields

Place field center, \vec{r}_0

Firing probability distribution

$$f(\vec{r}) = Fe^{-\frac{(\vec{r}-\vec{r}_0)^2}{s^2}}$$

A place field map of a 2 hole environment

An ensemble of N place cells forms a map of the environment

Information transmitted by the place cells to the downstream neurons

A schematic structure of the place field map

Information transmitted by the place cells to the downstream neurons

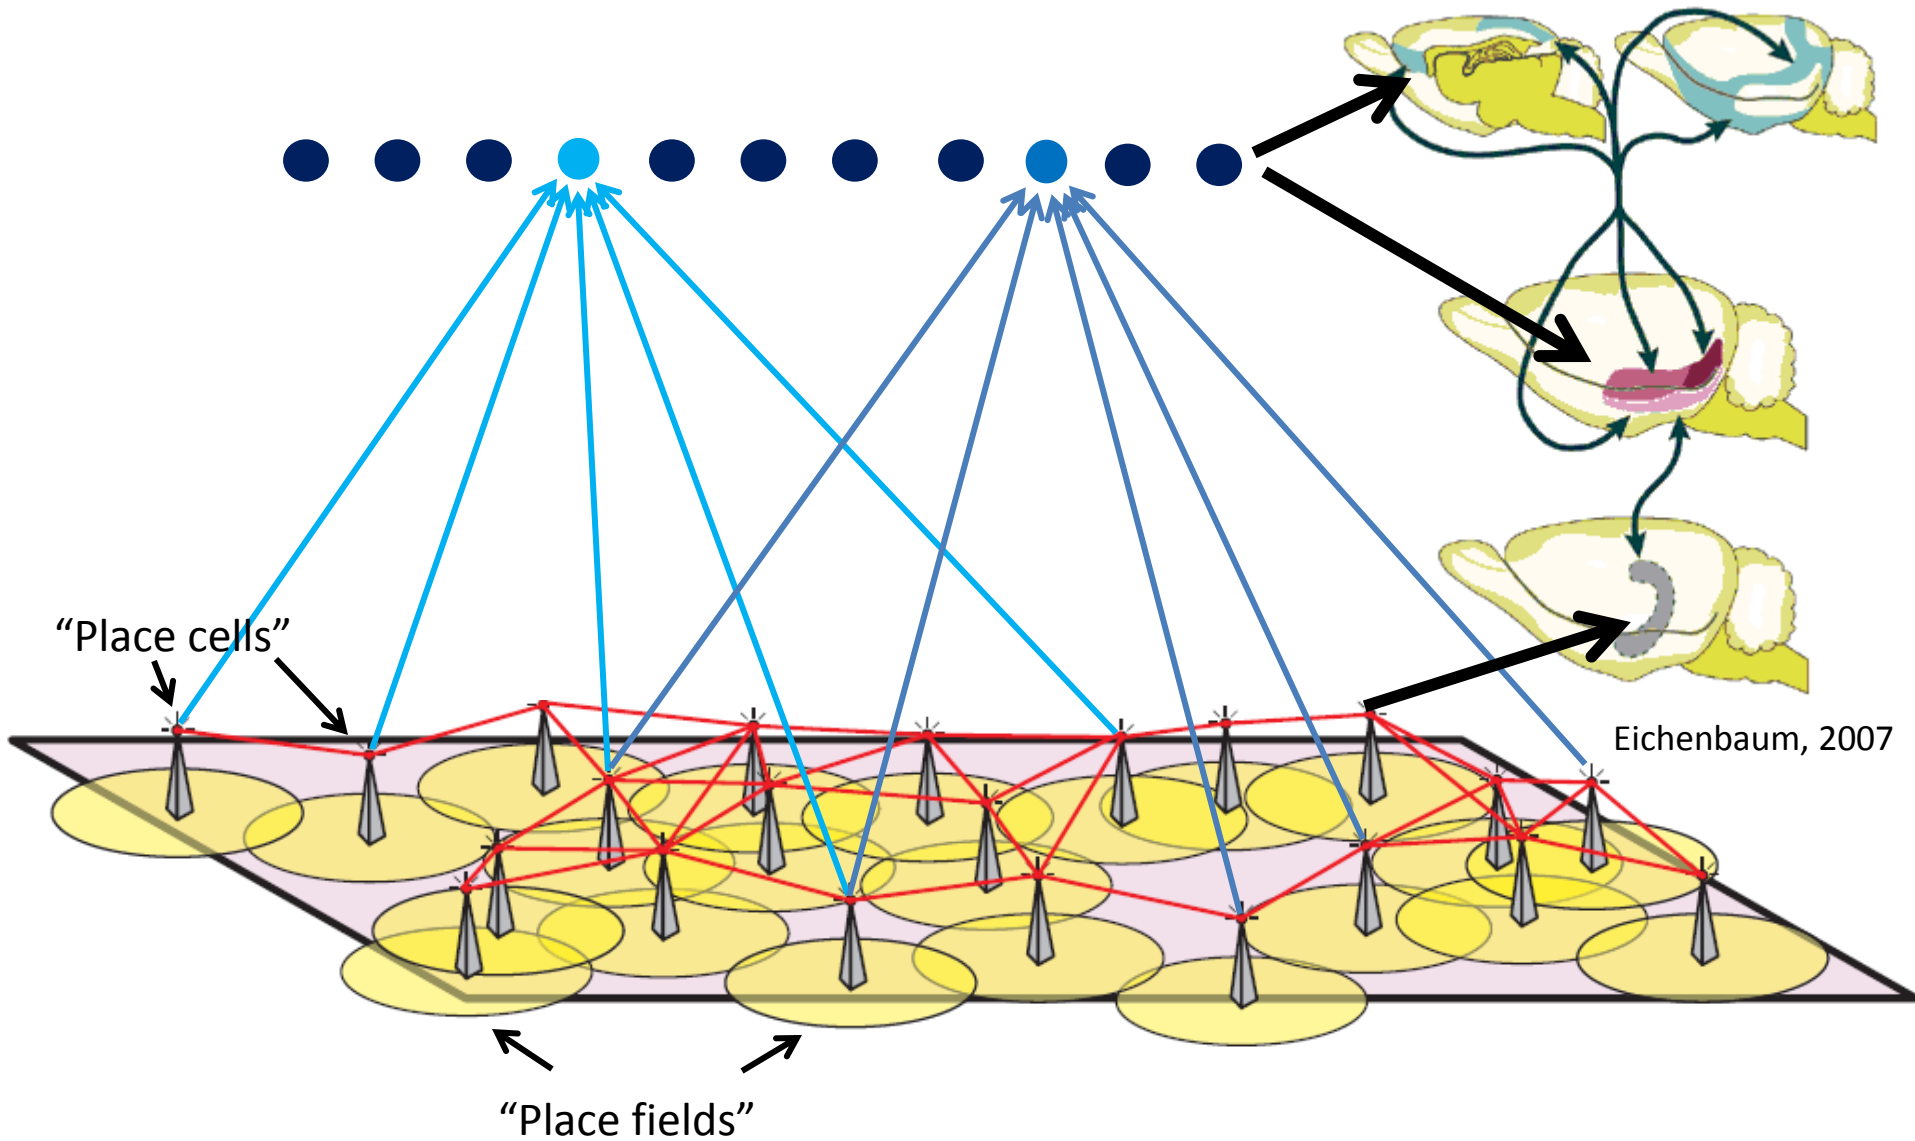

Topology from sensor networks

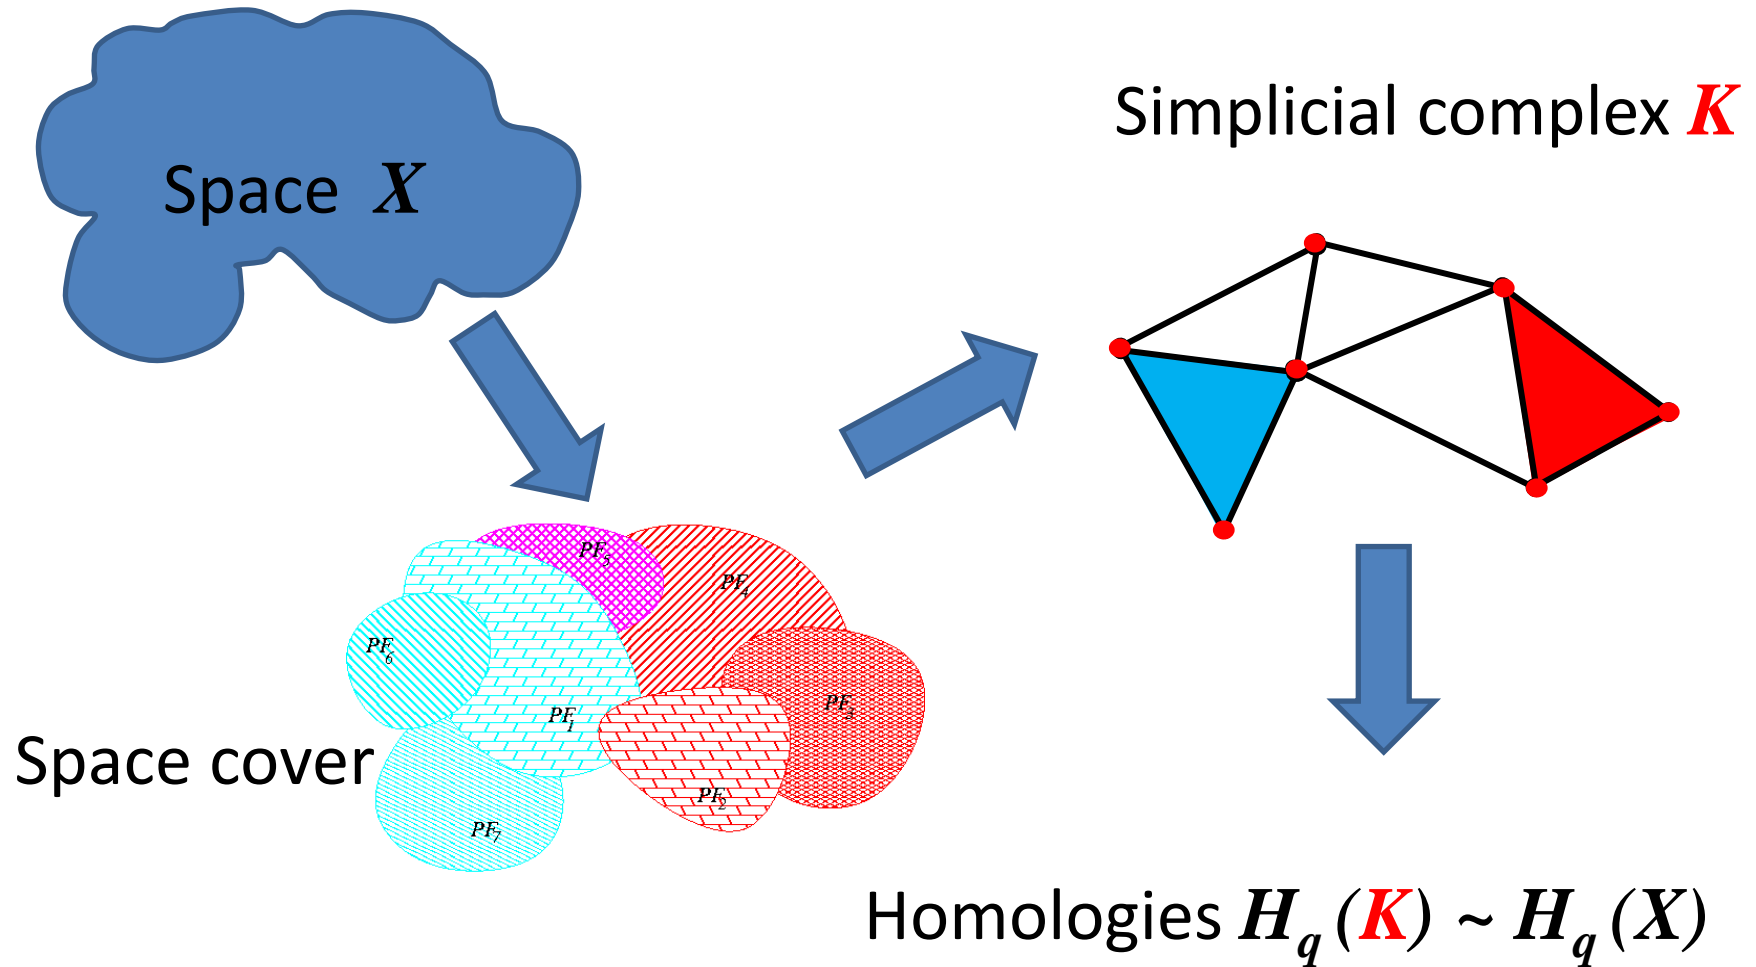

V. de Silva, Homological sensor networks, (2007)

Topology from neural networks

Topological analysis - Čech complex

Betti index – base cycles in every dimension

“Topological barcode”

Circle

$(1, 1, 0, 0, \dots)$

Sphere

Temporal Čech complex

Simplicial complex

Dabaghian et al., (2007)

Topological information unfolds in time

Accumulation of
topological information

Dabaghian et al, (2008)

Temporal coactivity \rightarrow place field connectedness

Can this actually work?

Can the map sustain biological variability?

Can this actually work?

Topics for topological analysis

- Is topology always extractible?
- Are the results robust?
- Does it take a reasonable time?

Answers depend on the quality of a map

Quality of the spatial map

Map characteristics:

- Firing rates of place cells
- Place field sizes
- Etc.

$$\langle F \rangle, \langle s \rangle, N$$

Quality of the spatial map

Map characteristics:

- Firing rates of place cells
- Place field sizes
- Etc.

$$\langle F \rangle, \langle s \rangle, N$$

Topological persistence

Topological persistence

Topological persistence

POINTS

ϵ -Balls

CČECH COMPLEX

Topological persistence

POINTS

CĚCH COMPLEX

Topological barcode of a sphere

Topological barcode (1, 0, 1, 0, 0 ...)

Computational test of a map's

A map model (rate and size distributions)

Computational test of a map's

A map model (rate and size distributions)

Persistent homology, loop dynamics

Learning time \rightarrow

t_{min}

Learning time via map parameters

$$T_{min} = T_{min} (\langle F \rangle, \langle s \rangle, N)$$

Learning time depends on map parameters

- a. firing rate, $\langle F \rangle$
- b. place field size, $\langle s \rangle$
- c. number of cells, N

Minimal learning times $T_{min} = T_{min}(\langle F \rangle, \langle s \rangle, N)$

Average times

Minimal learning times T_{min} , different arenas

Place cell ensemble activity parameters

firing rates

place field sizes

Minimal learning times, T_{\min}

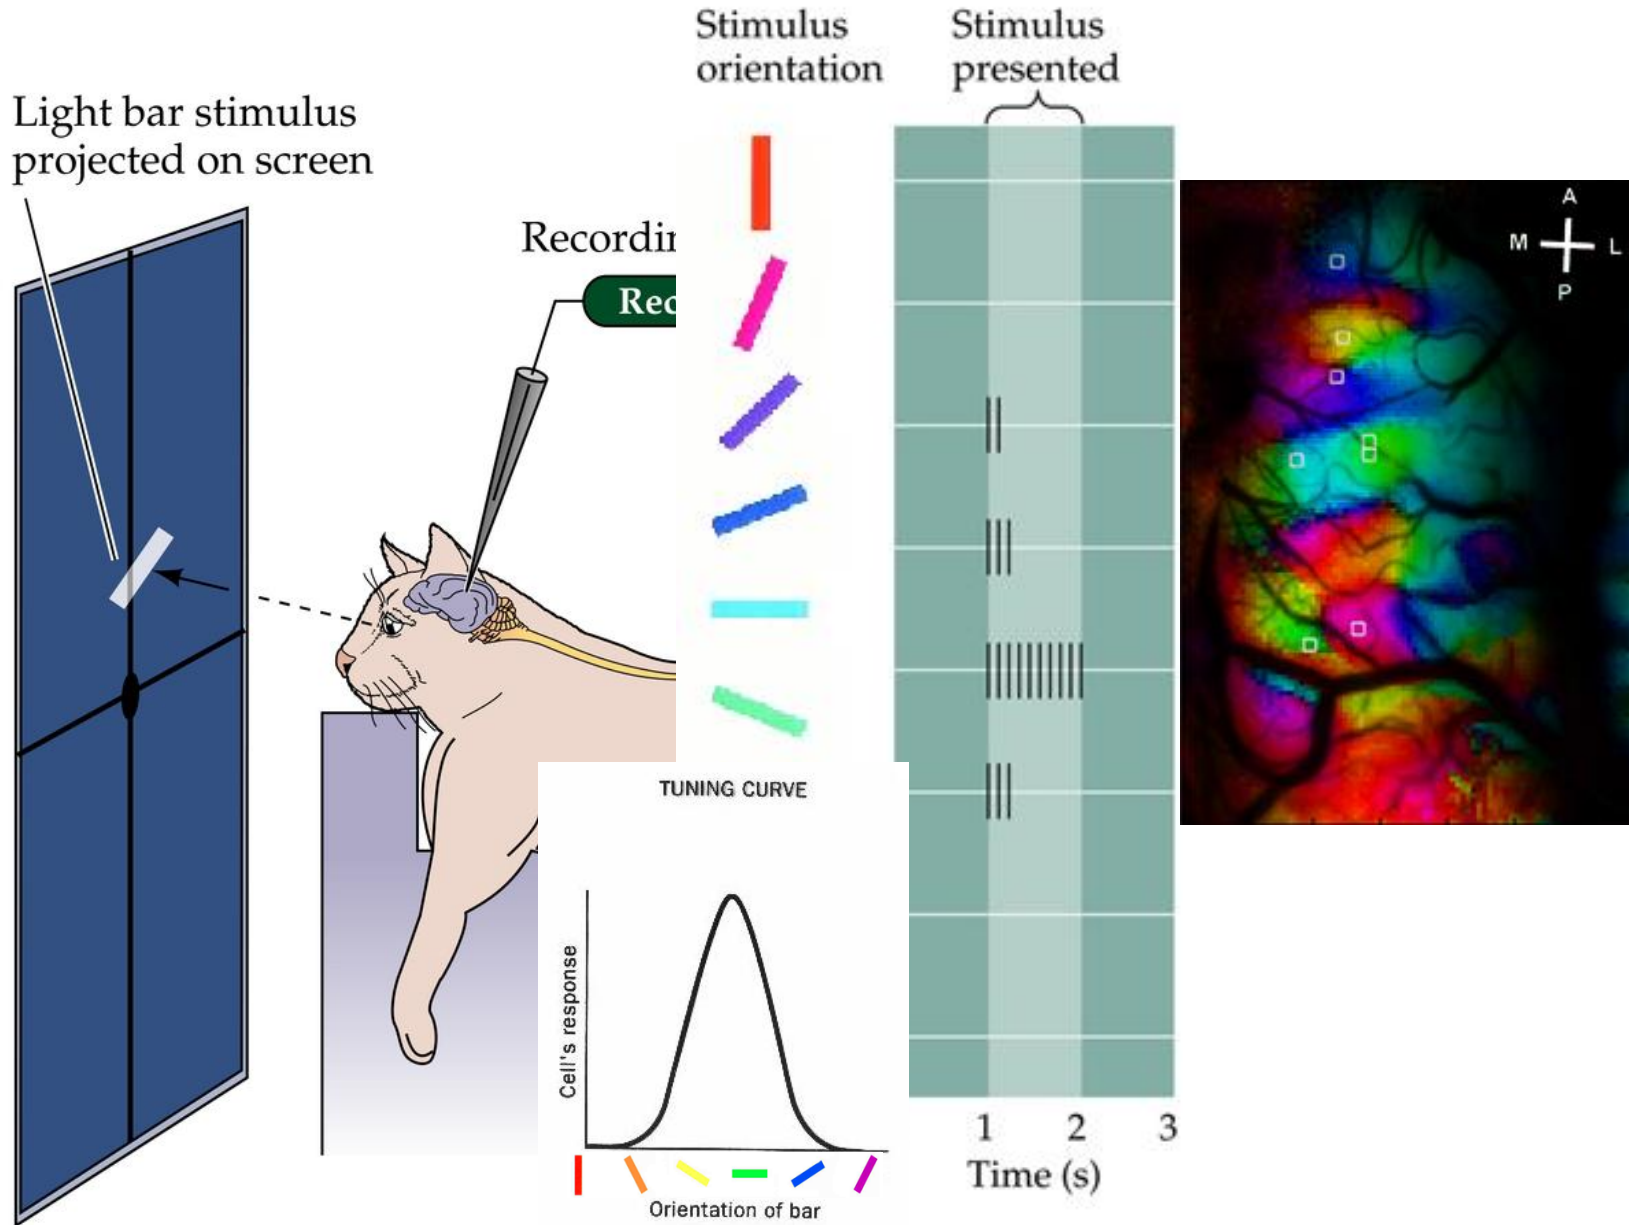

Predictive power of neuronal topology

1. Which parameters affect the map?
2. How does t_{min} change with the biological parameters?
3. How does t_{min} change with the geometry of the environment?
4. What is the “stability range” of the firing activity?
5. etc ...

Visual cortex

Neuroscience and geometry

...Quapropter bono christiano, sive mathematici, sive quilibet impie divinantium, maxime dicentes vera, cavendi sunt, ne consortio daemoniorum animam deceptam, pacto quodam societatis irretiant.

St. Augustine, Confessions II, xvii, 37

...Hence, a devout Christian must avoid mathematicians and all impious soothsayers, especially when they tell the truth, for fear of leading his soul into error by consorting with demons and entangling himself with the bonds of such association.
